The only way to eliminate this condition is that one must select a larger base circle radius or (if strength conditions permit) reduce the radius of the roller.

**What is the difference between a cam follower and a lifter?** The cam follower is a cylindrical device that tracks the shape of the cam lobe and reciprocates the movement to the opening and closing of the valves in the combustion chamber. The follower drives a piston that is enclosed in a cylindrical casing. This casing-piston assembly is known as the lifter.
