What is considered a microbe? Microbes are tiny living things that are found all around us. Also known as microorganisms, they are too small to be seen by the naked eye. They live in water, soil, and in the air. The human body is home to millions of these microbes too. Some microbes make us ill, others are important for our health.

Who first said I contain multitudes? Go back far enough – through not just the timeline but time itself – and you'll find its first usage, in Walt Whitman's seminal 1855 poem 'Song of Myself', from his collection Leaves of Grass: Do I contradict myself? Very well then I contradict myself, (I am large, I contain multitudes.)

What is the meaning of "I contain multitudes"? ?Multitudes refers to having varying thoughts, roles, paths etc. within ourselves that can both complement or contradict each other. When people say 'I contain multitudes' they mean that they have differences within them and these play out in the choices they make and lives they lead.

What is a common word for microbes that cause disease? Infectious diseases are caused by pathogens, which include bacteria, fungi, protozoa, worms, viruses, and even infectious proteins called prions.

Are most microbes harmful to humans? Microscopic creatures—including bacteria, fungi and viruses—can make you ill. But what you may not realize is that trillions of microbes are living in and on your body right now. Most don't harm you at all. In fact, they help you digest food, protect against infection and even maintain your reproductive health.

How do you know if the microbes are living? Instead we look for the amount of green and red fluorescence (i.e., the number of live and dead bacterial cells) using either a microscope or a fluorescence spectrometer, an instrument that shines light on the bacteria and monitors fluorescence.

Is mold a microbe? Mold is often used interchangeably with the word mildew. They are the generic terms that describe a variety of microorganisms, including fungi, algae, rusts, yeasts, and bacteria, that are agents of deterioration for museum objects. They produce irregular stains that can permanently damage an object.

Does everyone have the same microbes? The answers are likely to be complicated because the microbiome does not exist in a vacuum and no two human microbiomes are the same. There is a dynamic relationship between the microbiome and many other factors. One's individual genetic make-up may affect which microbes your body will encourage, tolerate, or reject.

What do microbes eat? Microbes need carbohydrates, fats, proteins, metals, and vitamins to survive, just like animals. The process of using nutrients and converting them into cellular material requires energy. Every microbe has unique nutritional requirements depending on the types of molecules it is capable of making for itself.
