Steel Construction Rules of Thumb for Floors and Beams

Question 1: What is a good rule of thumb for the maximum span of a steel floor beam?

- Answer: $L/20$, where L is the beam length in feet. This rule provides a balance between deflection and material usage.

Question 2: How do you determine the minimum beam size for a particular load?

- Answer: $M_x/F_y = S$, where M is the maximum bending moment in kip-feet, x is the distance from the beam's top to its neutral axis in inches, F_y is the yield strength of the steel in ksi, and S is the section modulus of the beam in inches cubed.

Question 3: What is a typical depth-to-span ratio for steel floor beams?

- Answer: $1/20$ to $1/15$. This ratio helps prevent excessive deflection and stabilizes the beam.

Question 4: How should you space steel beams for a floor system?

- Answer: Typically, beams are spaced 8 to 10 feet apart for residential applications and 5 to 8 feet apart for commercial buildings. Closer spacing increases the number of beams but reduces the deflections.

Question 5: What type of connections are commonly used for steel beams and floors?

- Answer:

- Bolted connections: Simple and cost-effective
- Welded connections: Stronger and more rigid
- Shear connections: Transfer shear forces between beams and floor decking
