Are electronic devices AC or DC? Everything that runs on a battery and uses an AC adapter while plugging into a wall or uses a USB cable for power relies on DC. Examples would be cellphones, electric vehicles, flashlights, flat-screen TVs (AC goes into the TV and is converted into DC).

Do appliances use AC or DC? Most household appliances and consumer electronics—cellphones, laptops, microwaves, light bulbs, you name it—use direct current (DC) electricity. But back when home outlets were first being invented, the decision was made to use alternating current (AC).

Do computers use AC or DC? Personal computers, like most electronic devices with transistors, run on direct current (DC). Your computer's power supply both converts the alternating current (AC) from an American wall socket to the DC necessary for the internal power needs of the computer, and regulates the voltage.

Is a TV remote AC or DC? On the other hand, the power supply in an average home is AC current, but what is used in electronic devices such as computers and home appliances such as televisions is DC current.
