But do not confuse this with a state of "no change"; at equilibrium, the forward and reverse reactions continue, but at identical rates, essentially cancelling each other out.

incomplete and non-transferable choices and non-convex demand and production.

What is the 2 law of equilibrium? The second law of the equilibrium of forces states that the vector sum of the torques, acting on a rigid unaccelerated object, is zero. The torque due to a force depends upon three things: The force acting on the body. The point at which this force acts.

How to calculate general equilibrium? The goal of general equilibrium is to find prices p_1, p_2, \dots, p_G for the goods in such a way that demand for each good exactly equals supply of the good. The supply of good g is just the sum of the endowments of that good. The prices yield a wealth for person n equal to $W_n = \sum_{g=1}^G p_g y(n, g)$.

changes as the value of temperature changes.

In other words, there is no net change in concentrations of reactants and products. This kind of equilibrium is also called dynamic equilibrium.
