Student Exploration: Collision Theory Gizmo Answers

The Collision Theory Gizmo is an interactive tool that allows students to explore the relationship between the collision rate of gas particles and the temperature of the gas. By manipulating the variables in the Gizmo, students can see how the average kinetic energy of the particles, the number of collisions, and the reaction rate are affected.

Paragraph 1

Question: How does the average kinetic energy of gas particles affect the collision rate? **Answer:** The average kinetic energy of gas particles is directly proportional to the collision rate. As the average kinetic energy increases, the particles move faster and collide with each other more frequently.

Paragraph 2

Question: How does the concentration of gas particles affect the collision rate? **Answer:** The concentration of gas particles is directly proportional to the collision rate. As the concentration increases, the number of particles in a given volume increases, and the likelihood of collisions occurring also increases.

Paragraph 3

Question: How does the temperature of a gas affect the collision rate? **Answer:** The temperature of a gas is directly proportional to the average kinetic energy of the gas particles. As the temperature increases, the average kinetic energy of the particles increases, and the collision rate also increases.

Paragraph 4

Question: How does the activation energy of a reaction affect the reaction rate? **Answer:** The activation energy of a reaction is the minimum amount of energy that the particles must have in order to react. As the activation energy increases, the

reaction rate decreases because fewer particles have the necessary energy to react.

Paragraph 5

Question: How can the Gizmo be used to predict the reaction rate of a given reaction? **Answer:** The Gizmo can be used to predict the reaction rate of a given reaction by manipulating the variables that affect the collision rate. By increasing the temperature, concentration, or activation energy, the reaction rate can be increased. By decreasing these variables, the reaction rate can be decreased.
