**What is the summary of compound light microscope?** Essentially a compound microscope is a high magnification microscope that uses 2 lenses to compound (multiply) the level of magnification. The first lens is referred to as the objective lens and typically has a 4x, 10x, 40x or 100 magnification ability). The second lens is known as the eyepiece lens.

**How to write a report about microscopy?**

**What can the compound light microscope be used for responses?** Compound microscopes typically provide magnification in the range of 40x-1000x, while a stereo microscope will provide magnification of 10x-40x. Compound microscopes are used to view small samples that can not be identified with the naked eye. These samples are typically placed on a slide under the microscope.

**What is the introduction of a compound microscope?** Compound microscope is an optical instrument which is used to obtain high magnification. It is an extension of the magnifying glass which are used to see very small things. The magnifying power of a simple lens is very limited.

**What is the summary of light microscopy?** Light Microscopy. A light microscope is any microscope that uses visible light to illuminate and image a specimen. This includes white light composed of all wavelengths, as well as the light of a specific wavelength used in fluorescent microscopy.

**What can a compound light microscope see?** With higher levels of magnification than stereo microscopes, a compound microscope uses a compound lens to view

specimens which cannot be seen at lower magnification, such as cell structures, blood, or water organisms.

### **How to write a laboratory report?**

**What is your conclusion about microscope?** It helps us see microorganisms that cannot be seen by our naked eye. It helps us identify diseases a human body have and also find cure for diseases.

**How do you report your findings after looking through a microscope?** Organisms and other cells that are observed on a Gram stained smear should be reported with as much description as possible. In addition to staining reaction, the shape of the organisms should be reported (e.g., cocci or bacilli).

**What is the summary of a microscope?** A microscope is an instrument that can be used to observe small objects, even cells. The image of an object is magnified through at least one lens in the microscope.

**What is the simple microscope summary?** The simple microscope consists of a single lens traditionally called a loupe. The most familiar present-day example is a reading or magnifying glass. Present-day higher-magnification lenses are often made with two glass elements that produce a colour-corrected image.

**What is the compound of the light microscope?** Compound microscopes usually include exchangeable objective lenses with different magnifications (e.g 4x, 10x, 40x and 60x), mounted on a turret, to adjust the magnification. These microscopes also include a condenser lens and iris diaphragm, which are important for regulating how light hits the sample.

**What is the function of light in compound microscope?** Illumination: Light used to illuminate the slide or specimen from the base of the microscope. Low voltage halogen bulbs are the most commonly used source of illumination for compound microscopes.
