What is the easiest sum in the world?

What are the 7 unsolved mathematics?

Has $3x-1$ been solved? The $3x + 1$ problem or Collatz Conjecture, also known as the $3n + 1$ problem, is a famous unsolved problem in mathematics that has puzzled mathematicians for over half a century. The problem is deceptively simple to state, but it has resisted all attempts to solve it.

What comes but never arrives? 18) Riddle: What is always coming but never arrives? Answer: Tomorrow. Explanation: You are always approaching the next day (i.e. tomorrow) but when it arrives it is no longer 'tomorrow' but instead it is 'today'.

What's a good math riddle? Riddle: If a hen and a half lay an egg and a half in a day and a half, how many eggs will half a dozen hens lay in half a dozen days? Answer: Two dozen. If you increase both the number of hens and the amount of time available four-fold (i.e., $1.5 \times 4 = 6$), the number of eggs increases 16 times: $16 \times 1.5 = 24$.

What is the hardest math problem no one can solve? Math problems like the Poincaré conjecture and Fermat's last theorem took centuries to solve. However, others like the Riemann hypothesis and Goldbach's conjecture still haunt mathematicians and inspire new generations to find solutions. Here we take a look at some of the hardest unsolved problems in math.

What's half of 24? Answer and Explanation: Half of 24 is 12.

What is half of 18? Half of 18 is 9.

What is half of \$5? Answer: Half of 5 is $\frac{5}{2}$ as a fraction and 2.5 as a decimal.

What is half of \$15? Answer and Explanation: Half of 15 is 7.5.

What are the methods of asphalt mix design? HMA mix design is the process of determining what aggregate to use, what asphalt binder to use and what the optimum combination of these two ingredients ought to be. There are several different methods used to go about this process, of which the Marshall and Superpave methods are the most common.

What is Marshall mix design? The Marshall method of mix design is for dense graded HMA mixes(DBM/AC). For a single selected. aggregate gradation, five different asphalt contents are tested for various volumetric and strength. criteria to select the optimum binder content. The test results should always be reported as the average.

What is the most commonly used asphalt mix? Of all the asphalt types available, hot mix asphalt is the most commonly used on roads, pavements. It is a flexible mix of fine and coarse aggregate and asphalt binder, which produces a highly weather-resistant pavement. Hot Mix Asphalt is heated and poured at temperatures of about 300 to 350 degrees Fahrenheit.

What is the best method of concrete mix design? Arbitrary Method The quantity of water in the cement paste is adjusted per the desired workability. For foundations and mass concrete work, the preferred concrete mix ratio is 1:4:8 while normal construction work can work with ratios 1:1.5:3 and 1:2:4.

What is the basic principle of mix design? Mix design is a selection of raw materials in optimum proportions to give concrete with required properties in fresh and hardened states for some special applications. The design of UHPC aims to achieve a densely compacted cementitious matrix with good workability and strength.

What is the American method of mix design? The ACI method bases the water-cement ratio selection on desired compressive strength and then calculates the required cement content based on the selected water-cement ratio.

What is the difference between standard mix and design mix? Nominal mix specifies the proportion of the cement, sand and aggregates without making special effort to know their individual properties. Nominal mix has Volumetric batching. However, design mix is a process where each and every ingredient of the concrete is first tested in the laboratory.

What are the methods of pavement design? There are two main types of road surfaces and pavement construction methods: rigid pavement (consisting of one layer) and flexible pavement (typically made up of multiple layers). Pavements are often made of materials such as asphalt or concrete.

Which is the most common method for bituminous mix design? 5.5.1 Marshall Mix Design According to the method, bitumen content corresponding to 4% air void (by weight of the mix) is determined and Marshall stability, flow, voids in mineral aggregates (VMA), voids filled with bitumen (VFB), and percent voids filled with bitumen (VFB) are calculated.

What is the difference between type A and B asphalt mix? A Type A mix is normally specified as a 5/8-inch (16 mm) mat thickness. Type B material is a fine graded mix composed of more angular materials and contains less binder content than the Type A mix (minimum of 6.4 percent). This mix is designed by the Marshall

Mix Design Method for light, medium, or heavy traffic.

What are the methods of grading asphalt? Asphalt binders are graded using four methods: Performance Grading (PG), which assesses behavior under various conditions; Penetration Grading, an empirical measure of consistency; Viscosity Grading, which measures flow properties; and Viscosity of Aged Residue Grading, predicting long-term performance.
