Subcision for Acne Scarring: With or Without Suctioning?

Subcision is a minimally invasive procedure used to treat acne scarring. It involves using a needle to break down the fibrous bands that connect the scars to the underlying tissue, allowing the skin to rise and fill in the depressed area. Suctioning can be added to the procedure to help further lift the skin and improve results.

Q: What is the difference between subcision with and without suctioning?

A: Subcision without suctioning involves using a needle to simply break up the fibrous bands. Subcision with suctioning, on the other hand, also uses a suction device to create a vacuum that helps lift the skin as the bands are broken down.

Q: Which method is more effective?

A: Studies have shown that both methods can be effective in reducing the appearance of acne scarring. However, subcision with suctioning may provide slightly better results, especially for deeper scars.

Q: What are the benefits of subcision with suctioning?

A: Benefits include:

- Improved skin texture and appearance
- Reduction of scar depth and visibility
- Minimally invasive with little downtime
- Can be combined with other scar treatments for enhanced results

Q: What are the risks of subcision with suctioning?

A: Risks include:

- Temporary bruising and swelling
- Infection (rare)
- Skin discoloration (rare)
- In very rare cases, scarring or nerve damage

Q: Who is a good candidate for subcision with suctioning?

A: Good candidates include those with:

- Depressed acne scars that are still soft and pliable
- Moderate to severe scarring that did not respond to other treatments
- Realistic expectations and understanding of the procedure
