Section 10-2 Rates of Nuclear Decay Worksheet Answers

Paragraph 1

Question: Define nuclear decay.

Answer: Nuclear decay is the spontaneous change of an unstable atomic nucleus to another, more stable nucleus. This process typically involves the emission of particles such as alpha particles, beta particles, or gamma rays.

Paragraph 2

Question: Explain the concept of half-life in nuclear decay.

Answer: Half-life is the amount of time it takes for one-half of a radioactive substance to decay. It is a constant value that is characteristic of each radioactive isotope.

Paragraph 3

Question: A radioactive isotope has a half-life of 10 hours. If you start with 100 grams of this isotope, how much of it will remain after 30 hours?

Answer: After 10 hours, 50 grams will remain (half of the original amount). After another 10 hours (total of 20 hours), 25 grams will remain (half of the 50 grams). After another 10 hours (total of 30 hours), 12.5 grams will remain (half of the 25 grams).

Paragraph 4

Question: What factors can affect the rate of nuclear decay?

Answer: The rate of nuclear decay is not affected by external factors such as temperature, pressure, or chemical environment. However, it is dependent on the following factors:

- The type of radioactive isotope
- The energy of the emitted particles
- The number of protons and neutrons in the nucleus

Paragraph 5

Question: Give an example of how nuclear decay is used in practical applications.

Answer: One practical application of nuclear decay is in carbon dating. This technique uses the decay of radioactive carbon-14 to determine the age of organic materials. It is used in archaeology, geology, and other fields to date artifacts, fossils, and other samples.
