The Basics of Industrial Ventilation\*\*

### **Definition**

Industrial ventilation is the process of controlling the air quality in industrial settings to protect workers from hazardous substances and ensure a comfortable working environment.

### **Three Basic Types of Ventilation Systems**

- **General ventilation:** Dilutes contaminants throughout the entire workspace.
- **Local exhaust:** Removes contaminants at the source of generation.
- **Makeup air:** Replaces air removed by exhaust systems to maintain a balanced air pressure.

### **Two Types of Industrial Ventilation**

- **Natural ventilation:** Uses natural forces (e.g., wind, temperature differences) to circulate air.
- **Mechanical ventilation:** Uses fans, blowers, or other equipment to control air movement.

## **OSHA Local Exhaust Ventilation**

OSHA (Occupational Safety and Health Administration) requires local exhaust ventilation to control airborne contaminants that pose a health hazard to workers.

### **When to Use Local Exhaust Ventilation**

Local exhaust ventilation should be used when:

- General ventilation is insufficient to control contaminants at the source.
- Contaminants are generated at high rates or in confined spaces.
- Workers are in close proximity to the source of contamination.

### **Exhaust vs. Ventilation**

Exhaust ventilation removes contaminated air from the workspace, while general ventilation dilutes contaminants throughout the space.

### **The 3 C's of Ventilation**

- **Capture:** Collecting contaminants at the source.
- **Conveyance:** Transporting contaminants away from the source.
- **Control:** Preventing contaminated air from escaping into the workspace.

### **Opposite of Exhaust Ventilation**

The opposite of exhaust ventilation is supply ventilation, which introduces fresh air into the workspace.

### **General Exhaust Ventilation**

General exhaust ventilation dilutes contaminants by mixing them with fresh air throughout the workspace.

### **Best Type of Ventilation**

The best type of ventilation depends on the specific application and contaminants involved. Local exhaust ventilation is generally more effective in controlling

contaminants at the source.

### **Difference Between Fresh Air and Exhaust**

Fresh air is clean, uncontaminated air brought into the workspace. Exhaust air is contaminated air removed from the workspace.

### **How to Design a Ventilation System**

Designing a ventilation system involves determining:

- Airflow rates
- Fan specifications
- Ductwork layout
- Filtration requirements

### **Basics of a Ventilation System**

A ventilation system includes:

- Fans or blowers to move air
- Ducts to transport air
- Filters to remove contaminants
- Controls to regulate airflow

### **Principle of Industrial Ventilation**

The principle of industrial ventilation is to control the concentration of contaminants in the workplace to acceptable levels for worker safety and health.
