The Symptom: From Freud to Lacan

What is the symptom?

In psychoanalysis, a symptom is a physical or psychological manifestation of an underlying unconscious conflict. It is a compromise formation, representing both the repressed desire and the defenses against it.

How did Freud understand the symptom?

Freud saw the symptom as a way for the unconscious to express itself. He believed that the repressed desire was always seeking to return to consciousness and that the symptom was a way of keeping it under control.

How did Lacan reinterpret Freud's concept of the symptom?

Lacan argued that the symptom is not simply a way for the unconscious to express itself, but that it is also a way for the subject to communicate with the analyst. He believed that through the symptom, the subject is trying to say something about their unconscious desires and conflicts.

What is the difference between Freud's and Lacan's views on the symptom?

Freud saw the symptom as primarily a defense against the unconscious, while Lacan saw it as a way for the subject to communicate with the analyst. Freud also believed that it was possible to cure the symptom by bringing the unconscious conflict to consciousness, while Lacan argued that the symptom is an essential part of the subject's identity.

How has the concept of the symptom been used in contemporary psychoanalysis?

The concept of the symptom has been used in contemporary psychoanalysis to understand a wide range of phenomena, including mental illness, addiction, and physical illness. The symptom can be seen as a way for the subject to communicate their unconscious desires and conflicts, and it can also be a way for the analyst to understand the subject's unique psychological makeup.
