What is an electrical circuit device? An electric circuit includes a device that gives energy to the charged particles constituting the current, such as a battery or a generator; devices that use current, such as lamps, electric motors, or computers; and the connecting wires or transmission lines.

What are electronic circuits and devices? An electronic circuit is composed of individual electronic components, such as resistors, transistors, capacitors, inductors and diodes, connected by conductive wires or traces through which electric current can flow. It is a type of electrical circuit.

What type of device should I use in an electric circuit? Electric Fuse. A fuse is a small conducting wire of low melting point which protects the household electrical system from getting damaged due to unusual high current.

What are three circuit control devices? Examples of control circuit devices used are switches, solenoids, and relays.

What are the examples of electrical devices and electronic devices? Examples of Electrical Devices: Transformers, generators, alternators, motors, circuit breakers, isolators. Examples of Electronic Devices: Integrated circuits, logic gates, microprocessors, diodes, SCRs, transistors.

What is the difference between an electrical circuit and an electronic circuit? The main difference between electrical and electronic circuits is that electrical circuits have no decision making (processing) capability, whilst electronic circuits do. An

electric circuit simply powers machines with electricity.

What is the difference between a device and a circuit? A device is a single circuit element, such as a resistor; a circuit is a subsystem that consists of several devices, such as an amplifier; and a system consists of multiple subsystems, such as a mobile phone.

Which type of circuits are used in homes? Parallel circuits keep the lights on in our homes and ensure that different appliances continue to work, even if other appliances are turned off. Parallel circuits are the standard circuits found in home electrical wiring and offer distinct advantages over other circuits.

What device is used to control electric current? The instrument used to control current in an electric circuit is Rheostat.

What device is used to activate a circuit? A 'switch' is an electric device that is used to make or break a circuit. When the switch is in 'OFF' position, then the circuit is not complete.

What are the output devices in an electric circuit? Output devices in an electronic circuit will transform electrical energy into some other form of energy; such as light energy, sound energy or kinetic energy. Examples of output devices are lamps, buzzers, loudspeakers, motors, relays and LED's.

What reduces current flow? Resistors, actually, are used to limit the excess flow of current.

What are three examples of devices that need electricity in a circuit? Light bulbs, fans, and buzzers are common loads. Think about a light bulb. When current passes through the wires inside the bulb, electrical energy changes into heat energy and light energy. Similarly, when current passes through a buzzer, electrical energy changes into sound energy.

What is considered an electrical device? Electric(al) devices are devices that functionally rely on electric energy (AC or DC) to operate their core parts (electric motors, transformers, lighting, rechargeable batteries, control electronics).

What is an example of an electrical device? Examples of electrical devices are electric fans (they work by converting electrical energy into rotational motion) and light bulbs (they transform electric energy into light).

What is an electrical circuit example? A simple electric circuit can consist of a battery (or other energy source), a light bulb (or other device that uses energy), and conducting wires that connect the two terminals of the battery to the two ends of the light bulb.

What is an electrical circuit in a home? A typical circuit in your home has two conductors: hot and neutral. Electricity travels from the service panel to home appliances through the hot conductor, and returns the current to the main service panel through the neutral conductor.
