3rd Semester Previous Question Paper Analysis for Karunya University Diploma (KUD)

Question 1: Explain the concept of a relational database management system (RDBMS).

Answer: An RDBMS is a software system designed to manage and organize large amounts of structured data in a relational model. It uses a series of tables, where each table consists of rows (records) and columns (attributes), to represent data. RDBMS provides features such as data integrity, data security, and data manipulation capabilities, making it a powerful tool for managing data.

Question 2: Describe the different types of joins used in SQL.

Answer: Joins in SQL are used to combine rows from two or more tables based on matching criteria. The different types of joins include:

- **Inner Join:** Combines rows from both tables where the matching criteria are met.
- **Outer Join:** Combines rows from both tables, even if the matching criteria are not met.
- **Cross Join:** Combines all rows from both tables, resulting in a Cartesian product.
- **Natural Join:** Combines rows from both tables based on matching columns with the same name.

Question 3: Explain the concept of data normalization and its benefits.

Answer: Data normalization is a process of organizing data in a database to reduce data redundancy and inconsistencies. It involves dividing data into smaller tables based on specific rules, ensuring that each table contains only the necessary data. Benefits of data normalization include:

- Reducing data duplication and saving storage space.
- Improving data integrity by eliminating data anomalies.
- Making data easier to access and manage.

Question 4: Describe the different types of data types supported in SQL.

Answer: SQL supports various data types to represent different types of data, including:

- **Integer:** Whole numbers.
- **Float:** Decimal numbers.
- **Character:** Strings of characters.
- **Date:** Dates.
- **Time:** Times.
- **DateTime:** Combinations of dates and times.
- **Boolean:** True or False values.

Question 5: Explain the concept of stored procedures and their advantages.

Answer: Stored procedures are pre-compiled SQL statements that are stored in the database and can be executed multiple times with different input parameters. Advantages of stored procedures include:

- Increased performance by reducing network traffic.
- Improved security by hiding SQL code from users.
- Enhanced modularity and code reuse.
- Simplified database administration by centralizing business logic.
