What is the difference between gram-positive and gram-negative bacteria? Gram-negative bacteria are surrounded by a thin peptidoglycan cell wall, which itself is surrounded by an outer membrane containing lipopolysaccharide. Gram-positive bacteria lack an outer membrane but are surrounded by layers of peptidoglycan many times thicker than is found in the Gram-negatives.

How to remember if bacteria is gram-positive or negative? Through the Gram staining technique, students can easily distinguish two major types of bacterial cells. Gram-positive bacteria stain purple, while Gram-negative ones stain red.

What is the difference between microbiology and medical microbiology? Microbiology is the science concerned with studying all microorganisms. Medical microbiology restricts this to the microbes that live on the human surface, and those there or elsewhere that may invade human tissues or otherwise cause infectious disease.
