## **Statics and Mechanics of Materials 2nd Edition Solutions Manual**

### **Introduction**

Statics and Mechanics of Materials 2nd Edition is a comprehensive textbook that covers the fundamental principles of statics and mechanics of materials. The textbook is designed for undergraduate engineering students who are studying these subjects for the first time. The solutions manual provides detailed and worked-out solutions to all the practice problems in the textbook, making it an invaluable resource for students who are struggling with the material or who want to verify their own solutions.

### **Question 1**

A force of 100 N is applied to a body at a distance of 2 m from the pivot point. What is the moment of the force about the pivot point?

### **Answer**

The moment of a force about a point is defined as the product of the force and the perpendicular distance from the point to the line of action of the force. In this case, the moment of the force is:

$$\text{Moment} = \text{Force} \times \text{Distance} = 100 \text{ N} \times 2 \text{ m} = 200 \text{ Nm}$$

### **Question 2**

A beam is supported at both ends and has a span of 6 m. The beam carries a uniformly distributed load of 500 N/m. What is the maximum bending moment in the

beam?

### Answer

The maximum bending moment in a simply supported beam carrying a uniformly distributed load occurs at the center of the beam. The maximum bending moment is:

$$\text{Maximum Bending Moment} = (\text{Load per unit length} \times \text{Span}^2) / 8 = (500 \text{ N/m} \times 2^2) / 8 = 250 \text{ Nm}$$

### Question 3

A steel rod has a diameter of 10 mm and a length of 2 m. The rod is subjected to a tensile load of 50 kN. What is the stress in the rod?

### Answer

The stress in a rod subjected to a tensile load is defined as the force per unit area. In this case, the stress is:

$$\text{Stress} = \text{Force} / \text{Area} = 50 \text{ kN} / (\pi (10 \text{ mm} / 2)^2) = 318.31 \text{ MPa}$$

### Question 4

A concrete beam has a rectangular cross-section with a width of 150 mm and a height of 200 mm. The beam is subjected to a shear force of 10 kN. What is the shear stress in the beam?

### Answer

The shear stress in a beam subjected to a shear force is defined as the force per unit area. In this case, the shear stress is:

$$\text{Shear Stress} = \text{Force} / \text{Area} = 10 \text{ kN} / (150 \text{ mm} \times 200 \text{ mm}) = 0.333 \text{ MPa}$$

### Question 5

A column has a height of 3 m and a cross-sectional area of 100 mm<sup>2</sup>. The column is subjected to a compressive load of 100 kN. What is the buckling load of the column?

### Answer

The buckling load of a column is the load at which the column fails due to buckling. The buckling load is given by:

$$\text{Buckling Load} = (\pi^2 \times \text{Elastic Modulus} \times \text{Area}) / (\text{Length}^2)$$

For steel, the elastic modulus is 200 GPa. Substituting the given values into the formula, we get:

$$\text{Buckling Load} = (\pi^2 \times 200 \text{ GPa} \times 100 \text{ mm}^2) / (3 \text{ m})^2 = 33.5 \text{ kN}$$
