7.1 Review and Reinforcement: Ionic Bonding (Dacral)

1. What is the difference between a cation and an anion?

A cation is a positively charged ion, while an anion is a negatively charged ion. Cations are formed when an atom loses one or more electrons, while anions are formed when an atom gains one or more electrons.

2. What is the net charge of an ionic compound?

The net charge of an ionic compound is zero. This is because the positive charges of the cations cancel out the negative charges of the anions.

3. What are the properties of ionic compounds?

Ionic compounds are typically solids at room temperature. They are hard and brittle, and they have high melting points and boiling points. Ionic compounds are also good conductors of electricity.

4. What is dacral?

Dacral is a trade name for a type of metal coating that is used to protect metal surfaces from corrosion. Dacral is a zinc-based coating that contains both cations and anions.

5. How does dacral work?

Dacral works by forming a barrier between the metal surface and the environment. This barrier prevents oxygen and water from reaching the metal surface, which prevents corrosion.

Additional Questions:

- What is the formula for sodium chloride?
- What is the name of the anion in potassium fluoride?
- Why are ionic compounds typically brittle?
- What are some other applications of ionic compounds?
- How can you tell if a substance is an ionic compound?

Uncle Albert's Catalog from Hell: A Complete Guide to the Most Terrifying Items

Uncle Albert's Catalog from Hell is a legendary tome that is said to contain a complete list of the most terrifying items in the universe. While the catalog itself is apocryphal, the items it supposedly contains are not.
