What is the common way to handle concurrency in Java? One of the best practices for handling concurrency in Java web services is to use thread pools, which are collections of pre-created threads that can execute tasks in parallel. Thread pools reduce the overhead of creating and destroying threads, and allow the web service to handle multiple requests efficiently.

How to avoid concurrency issues in Java?

Is ConcurrentLinkedQueue lock-free? These queues use the Queue as the base interface and implement the poll and offer methods. However, because of different internal implementations, they behave differently. While ConcurrentLinkedQueue poll and offer as completely lock-free.

When to use ConcurrentLinkedQueue in Java? A ConcurrentLinkedQueue is an appropriate choice when many threads will share access to a common collection. Like most other concurrent collection implementations, this class does not permit the use of null elements.

What is the difference between ConcurrentLinkedQueue and LinkedBlockingQueue? Blocking Behavior: LinkedBlockingQueue provides blocking operations, whereas ConcurrentLinkedQueue offers non-blocking operations. Synchronization Mechanism: LinkedBlockingQueue uses intrinsic locks and conditions for synchronization, while ConcurrentLinkedQueue employs lock-free algorithms and atomic operations.

If you want to limit the size of the queue, try a blocking queue, such as LinkedBlockingQueue or ArrayBlockingQueue instead.
