Strategy Game Theory: Joel Watson Solutions Manual

Question 1:

Explain the concept of Nash equilibrium in a strategy game.

Answer:

Nash equilibrium is a situation in which no player can improve their payoff by changing their strategy unilaterally, assuming all other players hold their strategies

constant. In other words, it is a situation where all players are playing their "best" strategies given the strategies of their opponents.

Question 2:

Describe the backward induction method for solving sequential games.

Answer:

Backward induction is an iterative method for solving sequential games. It starts by solving the game for the last decision node and working backward to the beginning of the game. At each decision node, the player considers the payoff they can receive from each possible action, taking into account the strategies that subsequent players will play.

Question 3:

Explain the difference between a pure and mixed strategy in a game.

Answer:

A pure strategy specifies a single action for each player in every possible situation. A mixed strategy, on the other hand, specifies a probability distribution over the set of possible actions for each player in each situation. Mixed strategies can be used to model situations where players are uncertain about the strategies of their opponents.

Question 4:

Discuss the role of information in strategy games.

Answer:

Information plays a crucial role in strategy games. The amount of information available to players can significantly impact their strategic choices and the overall outcome of the game. Perfect information games provide complete information to all players, while imperfect information games restrict information in some way.
