Transport in Cells: POGIL Answer Key

1. Passive vs. Active Transport

- **Q:** What are the two main types of transport across cell membranes?
- **A:** Passive transport and active transport
- **Q:** How does passive transport differ from active transport in terms of energy requirements?
- **A:** Passive transport does not require energy, while active transport requires energy.
- **Q:** Provide examples of passive and active transport.
- **A:** Examples of passive transport include diffusion and osmosis. Examples of active transport include the sodium-potassium pump and endocytosis.

2. Diffusion and Osmosis

- **Q:** What is the net movement of particles during diffusion?
- **A:** From an area of high concentration to an area of low concentration
- **Q:** What factors affect the rate of diffusion?
- **A:** Temperature, concentration gradient, surface area, and distance

- **Q:** Explain the process of osmosis.
- **A:** Osmosis is the net movement of water across a semipermeable membrane from an area of high water concentration to an area of low water concentration.

3. Facilitated Diffusion

- **Q:** What is facilitated diffusion?
- **A:** Facilitated diffusion is the passive transport of substances across a cell membrane with the assistance of carrier proteins.
- **Q:** How does facilitated diffusion differ from simple diffusion?
- **A:** Facilitated diffusion is faster and more specific than simple diffusion, and it can transport molecules that cannot cross the lipid bilayer on their own.
- **Q:** Provide an example of facilitated diffusion.
- **A:** Glucose transport across the cell membrane is an example of facilitated diffusion.

4. Active Transport

- **Q:** What is the purpose of active transport?
- **A:** Active transport moves substances across a cell membrane against their concentration gradient, from an area of low concentration to an area of high concentration.

- **Q:** How does active transport work?
- **A:** Active transport uses energy from ATP to power the transport proteins that move substances across the membrane.
- **Q:** Provide an example of active transport.
- **A:** The sodium-potassium pump is an example of active transport that maintains the correct ion concentrations inside and outside of cells.

5. Endocytosis and Exocytosis

- **Q:** What are endocytosis and exocytosis?
- **A:** Endocytosis is the process of bringing substances into a cell by engulfing them in a membrane-bound vesicle. Exocytosis is the process of releasing substances from a cell by fusing a membrane-bound vesicle with the cell membrane.
- **Q:** What are the three main types of endocytosis?
- **A:** Phagocytosis, pinocytosis, and receptor-mediated endocytosis
- **Q:** Give an example of exocytosis.
- **A:** Neurotransmitter release from presynaptic neurons is an example of exocytosis.
