Tension Control Bolts Grade S10T in Friction Grip Connections

Introduction In structural steel construction, friction grip connections are widely used to join structural members. Tension control bolts are a crucial component in these connections, ensuring the required clamping force. Grade S10T tension control bolts are a specific type designed for use in friction grip applications.

Question: What is the key difference between Grade 8 and Grade S10T tension control bolts? Answer: The primary distinction lies in their yield strength. Grade S10T bolts have a higher yield strength than Grade 8 bolts, allowing them to withstand greater tensile forces. This enhanced strength makes them suitable for friction grip connections where high clamping force is essential.

Question: What is the recommended hole size for Grade S10T tension control bolts? Answer: The standard hole size for Grade S10T bolts is 1/16 inch larger than the nominal bolt diameter. This oversize allows for the proper deformation of the bolt under tension, creating the required friction grip.

Question: How is the tension in Grade S10T bolts controlled? Answer: Tension control bolts are tightened using a specific installation method. A controlled torque is applied to stretch the bolt, which elongates the bolt by a predetermined amount. This elongation ensures that the desired clamping force is achieved.

Question: What safety precautions should be taken when using Grade S10T tension control bolts? Answer: Always follow the manufacturer's instructions for installation. Verify the correct hole size and use the appropriate torque wrench to

control tension. Proper training and certification are recommended for installers.

Conclusion Grade S10T tension control bolts are a critical component in friction grip connections, providing a reliable and efficient means of joining structural members. By understanding the key characteristics, installation techniques, and safety precautions, engineers and contractors can effectively utilize these bolts to ensure the integrity of structural steel connections.
