**What is replacing the Functional Independence Measure?** Objective: The Functional Independence Measure (FIM) had been the gold-standard for assessing patients' function in rehabilitation for many years. However, as of October 2019, the Continuity Assessment Record and Evaluation (CARE) item set was implemented.

**Are FIM scores still used?** Depending on where you work, your facility may still utilize the FIM but many facilities have begun to use the CARE, Continuity Assessment Record and Evaluation, Item Set. This tool was adopted by Medicare to be used as a standardized assessment tool at acute discharge and post acute admission and discharge.

**Does the FIM require training?** New users of the FIM or WeeFIM instrument are required to attend a training workshop prior to attempting a credentialing exam.

Workshops provide education on how to score the instrument.

**Is FIM reliable and valid?** Median and mean reliability coefficients for FIM motor items were generally higher than for items in the cognitive or communication subscales. Conclusions: Based on the 11 studies examined in this review the FIM demonstrated acceptable reliability across a wide variety of settings, raters, and patients.

**What is replacing the FIM?** CMS mandated the use of Section GG beginning October 2016 and officially replaced the FIM functional items in October 2019. 6. There is limited information of direct comparison between Section GG and FIM.

**What is the difference between WeeFIM and FIM?** WeeFIM is the paediatric version of FIM. It is very similar to the adult FIM but differs in its scoring processes in order to take into account the child's developmental stages.

**Who can administer Functional Independence Measure?** The FIM must be administered by a trained and certified evaluator. Grey and Kennedy (1993) found that the FIM could be completed as a self-report questionnaire in patients with spinal cord injury.

**What is the difference between the Barthel Index and the Functional Independence Measure?** The Barthel Index is currently used in the ICTOP Comprehensive Geriatric Assessment (CGA). It is an ordinal scale and measures activities of daily living performance. Functional Independence Measure (FIM) is used to assess and grade a person's functional status.

**What is the 7 point scale for Functional Independence Measure?** Each dimension is rated on a 7-point scale: 7 is complete independence, 6 is modified independence, 5 equals supervision or setup, 4 equals minimal contact assistance (client expends 75% or more of the effort), 3 is moderate assistance (client expends between 50% and 75% of the effort), 2 is maximal assistance (client ...

**What is the cut off for Functional Independence Measure?** A total FIM score cut-off value of 63 points is useful to discriminate patients with adverse events among those with acute stroke.

**What is the age limit for the FIM scale?** Children aged 0 to 3. years – no WeeFIM® (or FIM™) is required. Children aged 3 to 8 years – WeeFIM® must be used because age norms apply. Children aged 8 to 18 years – as no age norms apply, either WeeFIM® or FIM™ can be used.

**What is the normal range for Functional Independence Measure?** This score is a value that ranges between 18 and 126. The FIM score can also be further broken down based on its motor and cognitive components. The motor component of the FIM score can range between 13 and 91, while the cognitive component can range between 5 and 35.

**Is the functional independence measure standardized?** What it measures: Provides a uniform system of measurement for disability based on the International Classification of Impairment, Disabilities and Handicaps; measures the level of a patient's disability and indicates how much assistance is required for the individual to carry out activities of daily living.

**Is FIM an outcome measure?** One of the most widely used tools is the Functional Independence Measure (FIM). Data from the FIM are used to examine patient outcomes for several purposes.

**How to score the FIM?** The FIM score is calculated by adding the motor and cognitive subscales scores, resulting in a total score between 18 and 126. A higher score indicates greater functional independence. The FIM score has seven levels, each indicating a patient's level of independence in performing activities of daily living (ADLs).

**What is the difference between FIM and Barthel?** The Barthel Index is currently used in the ICTOP Comprehensive Geriatric Assessment (CGA). It is an ordinal scale and measures activities of daily living performance. Functional Independence Measure (FIM) is used to assess and grade a person's functional status.

**What is the Functional Independence Measure?** The Functional Independence Measure (FIM) is another rehabilitation-oriented scale that scores motor and cognitive skills based on the amount of assistance required to complete a task.

**What is the cut off for Functional Independence Measure?** A total FIM score cut-off value of 63 points is useful to discriminate patients with adverse events among those with acute stroke.

**Is the FIM an outcome measure?** One of the most widely used tools is the Functional Independence Measure (FIM). Data from the FIM are used to examine patient outcomes for several purposes.
