Saturated and Unsaturated Solutions

Q: What is a saturated solution? **A:** A saturated solution is one in which no more solute can be dissolved at a given temperature. When a saturated solution is in contact with excess solute, the solute will no longer dissolve, but will instead crystallize out of the solution.

Q: What is the difference between a saturated, unsaturated, and supersaturated solution? **A:** The three types of solutions are defined by the amount of solute that is dissolved in them. An unsaturated solution contains less solute than a saturated solution, and a supersaturated solution contains more solute than a saturated solution. In a supersaturated solution, the solute is present in a metastable state, and can spontaneously crystallize out of solution.

Q: How can you tell if a solution is saturated? **A:** You can tell if a solution is saturated by adding more solute to the solution. If the solute dissolves, then the solution is unsaturated. If the solute does not dissolve, then the solution is saturated.

Q: What factors affect the solubility of a solute? **A:** The solubility of a solute is affected by a number of factors, including the temperature of the solution, the nature of the solute and solvent, and the pressure of the solution. In general, the solubility of a solute increases with increasing temperature and pressure.

Q: What happens when a solution is heated? **A:** When a solution is heated, the solubility of the solute usually increases. This is because the heat provides the energy needed to overcome the intermolecular forces that hold the solute and solvent molecules together.
