What are the basic requirements of a dyeing machine?

What are the parameters of dyeing machine?

What is the function of dyeing machine? Dye solution is sprayed or jet-fed on to the fabric as the fabric passes through the nozzle, which is the main place that dye solution exchanges with fabric in terms of dye exhaustion. During repeated fabric circulation inside the machine, a dyeing process is carried out.

What are the equipments used in dyeing?

What is the liquor ratio of a dyeing machine? Process control in dyeing of textiles Water is an essential medium for a dyeing process in most dyeing methods. The

liquor ratio in an exhaust dyebath is the ratio of the weight of the dry material being dyed to the water weight of the dyebath. Example, a liquor ratio of 1:10 implies 1 kg fibre is dyed in 10 L water.

What are the basic principles of dyeing? Basic Dyeing Principles First, a substrate is placed in a medium, most often water, to which dyestuffs and auxiliary chemicals have been added. Dyes are then adsorbed to the surface of the substrate and slowly diffuse into the fiber. Once inside the fiber, dyes migrate (or level out) and are then fixed to the fiber.

What is the cycle time in a dyeing machine? In this method the materials are immersed in a required level of water and both the material and the dye liquor simultaneously move through the machine with the help of a pump and a separately driven reel (Winch). The time required to move the whole loop is termed as cycle time.

What is the formula for dyeing? Required Dye = (Shade percentage (%) x Weight of the fabric in gram (gm) /percentage (%) of Stock solution. Conversion formula from percentage to gram/ liquor is as below : Gram/liquor = Required amount (%) x 10 .

What are the machine parameters? The Machine Parameters screens list various parameters, the range of values that can be set for each parameter, and the current set or default value. The values of the Machine Parameters may be changed by the operator.

What is a dyeing machine operator job description? What is a Dyeing Machine Operator? A dyeing machine operator is responsible for operating and overseeing machinery used in the dyeing process of textiles. They play an important role in ensuring the efficient and accurate dyeing of fabrics, yarns, or garments according to specific requirements and quality standards.

What is the function of heat exchanger in dyeing machine? Thirdly, the dual heat exchanger system provides precise temperature control for both the liquor in the main body and the reserve tank, resulting in consistent and high-quality dyeing results.

What is a fabric dyeing machine called? Jigger Dyeing Machines: Jigger dyeing machines are suitable for dyeing woven fabrics. The fabric is wound onto a roller, which is then submerged in a dye bath. The roller is rotated to ensure uniform dye penetration. Jigger machines are known for producing uniform dyeing results and are commonly used for dyeing denim.

Which chemical is used for dyeing? Na_2CO_3 (sodium carbonate) : Widely used in reactive dyeing. $\text{Ca}(\text{OH})_2$ (Calcium hydroxide): To remove the hardness of water, formation of bleaching chemicals, mordant and indigo vat, etc. Salt: Different types of salts are used in different processes for different purposes of textile dyeing and finishing.

What is the technical theory of dyeing process? Dyeing theory is concerned with how a given dye is taken up by a particular textile fibre. Two approaches are used to study the mechanism of dyeing insofar as the dyeing system is studied: at equilibrium (thermodynamics of dyeing) and before equilibrium is attained (kinetics of dyeing).

What is the top dyeing process? The top dyeing process is the most popular dyeing method. It involves immersion of cloth or yarn in a dyebath and then in a dye solution. This dyeing method can be used for both natural and synthetic fabrics.

What are the requirements for dyes? ? To be used dye must possess these four properties. (i) Color (ii) Solubility in water and/or an organic solvent. (iii) Ability to be absorbed and retained by fiber (substantivity) or to be chemically combined with it (reactivity). (iv) Ability to withstand washing, dry cleaning and exposure to light.

What are the requirements of a substance to act as a dye? Unlike most organic compounds, dyes possess colour because they 1) absorb light in the visible spectrum (400–700 nm), 2) have at least one chromophore (colour-bearing group), 3) have a conjugated system, i.e. a structure with alternating double and single bonds, and 4) exhibit resonance of electrons, which is a ...

What are the basic operations in the dyeing process? A dyeing process is the interaction between a dye and a fibre, as well as the movement of dye into the internal part of the fibre. Generally, a dyeing process involves adsorption (transfer of

dyes from the aqueous solution onto the fibre surface) and diffusion (dyes diffused into the fibre).

What are the basics of dye? Basic dyes are water-soluble cationic dyes that are mainly applied to acrylic fibers, but find some use for wool and silk. Usually acetic acid is added to the dye bath to help the uptake of the dye onto the fiber. Basic dyes are also used in the coloration of paper.
