Tiling with Polyominoes and Combinatorial Group Theory

Question 1: What are polyominoes? Answer: Polyominoes are geometric shapes formed by joining squares edge-to-edge. They are classified according to their number of squares, called their order.

Question 2: How are polyominoes related to tiling? Answer: Tiling a plane or surface with polyominoes is a classic combinatorial problem. The goal is to determine which shapes can tile a given area without gaps or overlaps.

Question 3: Where does combinatorial group theory come into play? Answer: Combinatorial group theory provides a powerful framework for studying tiling problems. Groups can be used to represent the symmetries of polyominoes and to identify patterns in their tilings.

Question 4: How has combinatorial group theory been used to solve tiling problems? Answer: Combinatorial group theory has been used to prove results such as the Heesch-Gansner Theorem, which characterizes the tilings of the plane by convex polyominoes. It has also been employed to study aperiodic tilings, which do not possess any translational symmetry.

Question 5: What are some open problems in this area of research? Answer:

Despite the significant progress that has been made, there remain many open questions in tiling with polyominoes and combinatorial group theory. These include finding new ways to characterize tilings, determining the complexity of tiling problems, and exploring the connections between tiling and other areas of mathematics.
