Question:

What is the probability that a person who plays the lottery every week for a year will win at least one time?

Answer:

According to Sheldon Ross's Probability & Statistics 4th edition, the probability of winning the lottery in any given week is p . If we assume that the person plays the lottery every week for a year, there are $n = 52$ weeks in a year. Using the complement rule, the probability of not winning at all is $(1-p)^{52}$. Thus, the probability of winning at least once is $1 - (1-p)^{52}$.

Question:

A fair six-sided die is rolled twice. What is the probability of getting a sum of 7?

Answer:

There are six possible outcomes for each roll of the die, resulting in 36 possible outcomes for two rolls. The outcomes that sum to 7 are (1,6), (2,5), (3,4), (4,3), (5,2), and (6,1). Thus, the probability of getting a sum of 7 is $6/36 = 1/6$.

Question:

A random sample of 100 people is taken to estimate the proportion of people who support a particular political candidate. If the sample proportion is 0.6, what is the 95% confidence interval for the true population proportion?

Answer:

Using Sheldon Ross's formula for a confidence interval for a proportion, the 95% confidence interval is: $0.6 \pm 1.96 \sqrt{0.6 \cdot 0.4 / 100} = (0.52, 0.68)$.

Question:

A store sells two types of batteries: regular and heavy-duty. The probability that a regular battery lasts more than two years is 0.8, and the probability that a heavy-duty battery lasts more than two years is 0.9. If 60% of the batteries sold are regular and 40% are heavy-duty, what is the probability that a randomly selected battery lasts more than two years?

Answer:

Let R denote the event that a regular battery is selected and H denote the event that a heavy-duty battery is selected. Then, the probability that a randomly selected battery lasts more than two years is:

$$P(\text{lasts} > 2) = P(\text{lasts} > 2 \mid R) P(R) + P(\text{lasts} > 2 \mid H) P(H) = 0.8 \cdot 0.6 + 0.9 \cdot 0.4 = 0.84$$

Question:

The time until a machine breaks down follows an exponential distribution with parameter $\lambda = 0.01$. What is the probability that the machine will break down within the next hour?

Answer:

The probability density function of an exponential distribution is given by $f(x) = \lambda e^{-\lambda x}$. Thus, the probability that the machine will break down within the next hour is:

$P(X < 1) = \text{integral from 0 to 1 of } f(x) \, dx = 1 - e^{(-\lambda)} = 0.0099$
