Potassium Nitrate Solubility Curve Lab Answers

Introduction A solubility curve is a graph that shows the relationship between the temperature of a solution and the maximum amount of solute that can be dissolved in that solution. The solubility curve for potassium nitrate (KNO_3) is a useful tool for predicting the solubility of KNO_3 at different temperatures.

Question 1: What is the solubility of potassium nitrate at 20°C ?

Answer: According to the solubility curve, the solubility of potassium nitrate at 20°C is approximately 32 g/100 mL of water.

Question 2: How does the solubility of potassium nitrate change with temperature?

Answer: The solubility of potassium nitrate increases with increasing temperature. This is because the solubility of most solids increases with temperature.

Question 3: What is the shape of the solubility curve for potassium nitrate?

SOLUTIONS BIPIN C DESAI

Answer: The solubility curve for potassium nitrate is a non-linear curve. It rises steeply at low temperatures but levels off at higher temperatures.

Question 4: What is the significance of the point where the solubility curve levels off?

Answer: The point where the solubility curve levels off is known as the saturation point. At this point, the solution is saturated with potassium nitrate and can no longer dissolve any more solute.

Question 5: How can the solubility curve be used to predict the solubility of potassium nitrate at a given temperature?

Answer: To predict the solubility of potassium nitrate at a given temperature, find the corresponding point on the solubility curve and read the solubility value from the y-axis.
