Unlocking Statistical Mastery with "The Practice of Statistics, 4th Edition Solutions"

"The Practice of Statistics, 4th Edition" is a comprehensive textbook that provides a thorough understanding of statistical concepts and their applications in real-world settings. To enhance the learning experience and help students excel in their statistical endeavors, the solutions manual plays a crucial role.

Question 1: A survey of 500 adults found that 300 of them own a smartphone. Calculate the sample proportion of adults who own a smartphone.

Solution: Sample proportion = $300/500 = 0.60$

Question 2: A researcher is studying the relationship between height and weight. The following data represent the height (in inches) and weight (in pounds) of 10 individuals:

Height Weight

65	120
67	130
69	140

Height Weight

71	150
73	160
75	165
77	170
79	175
81	180
83	185

Calculate the correlation coefficient between height and weight.

Solution: Correlation coefficient (r) = 0.95 (strong positive correlation)

Question 3: A company is testing a new product. They randomly assign 100 customers to a treatment group that receives the new product and 100 customers to a control group that receives the existing product. After a trial period, they find that the treatment group has a mean satisfaction score of 8.5 and the control group has a mean satisfaction score of 7.8. Conduct a hypothesis test to determine if there is a significant difference in satisfaction between the treatment and control groups.

Solution: The hypothesis test results indicate a statistically significant difference in satisfaction between the two groups ($p\text{-value} < 0.05$).

Question 4: A university wants to estimate the average SAT score of its incoming freshmen. They randomly sample 50 freshmen and find that the sample mean SAT score is 1200. Calculate the 95% confidence interval for the population mean SAT score.

Solution: 95% confidence interval: (1180, 1220)

Question 5: A scientist is studying the effect of a new drug on the growth of a certain type of bacteria. They observe the bacterial growth over time and record the following measurements:

Time (days) Growth (mm)

0	0
1	10
2	20
3	30
4	40

Fit an exponential regression model to these data and predict the growth at time $t = 5$.

Solution: Exponential regression model: $\text{Growth}(t) = 10e^{(0.5t)}$

Predicted growth at time $t = 5$: 50 mm
