**What is fertilization explained easy?** Fertilization, simply, is the joining of an egg and a sperm. It happens inside a woman's reproductive system and is the first step of a pregnancy. It specifically involves the joining of the female reproductive cells (egg) with the male reproductive cell (sperm).

**What are the three phases of fertilization?** It involves distinct events with the following order: (1) the migration of spermatozoa through the cumulus matrix, (2) the adhesion and penetration of spermatozoa to the zona pellucida, and (3) the fusion of the two plasma membranes.

**Can 3 day old sperm fertilize an egg?** Once inside the body of a woman, a healthy sperm can live up to 2-5 days. Once the sperm reaches the released egg, it does not mean that it is capable of fertilizing it immediately. The sperm will then undergo a process called capacitation in the reproductive tract. This process will take about 10 hours.

**What is female sperm called?** In animals, female gametes are called ova or egg cells, and male gametes are called sperm. Ova and sperm are haploid cells, with each cell carrying only one copy of each chromosome.

**Can an egg reject sperm?** A new study by researchers from Stockholm University and Manchester University NHS Foundation Trust (MFT) shows that choosing your partner continues even after sex – human eggs can “choose” sperm.

**Where do the egg and sperm meet?** The egg and the sperm meet in the fallopian tube where the sperm start to digest the sticky cells. While it takes only one sperm to

make a baby, several need to attach to the outer shell and the membrane of the egg before one can enter and fertilise it.

**What cell is formed in fertilization?** During fertilization, sperm and egg fuse to form a diploid zygote to initiate prenatal development.

**What is a zygote?** zygote, fertilized egg cell that results from the union of a female gamete (egg, or ovum) with a male gamete (sperm). In the embryonic development of humans and other animals, the zygote stage is brief and is followed by cleavage, when the single cell becomes subdivided into smaller cells.

**What is in fertilization?** During fertilization, the sperm and egg unite in one of the fallopian tubes to form a zygote. Then the zygote travels down the fallopian tube, where it becomes a morula. Once it reaches the uterus, the morula becomes a blastocyst. The blastocyst then burrows into the uterine wall — a process called implantation.

**What is an example of fertilization?** Sexual reproduction starts with the combination of a sperm and an egg in a process called fertilization. This can occur either inside (internal fertilization) or outside ( external fertilization) the body of the female. Humans provide an example of the former whereas seahorse reproduction is an example of the latter.

**What is the definition of fertilization quizlet?** Fertilization. the action or process of fertilizing an egg, female animal, or plant, involving the fusion of male and female gametes to form a zygote. Zygote. a diploid cell resulting from the fusion of two haploid gametes; a fertilized ovum.
