World Robotics 2017: Insights from the International Federation of Robotics

Question: What are the latest findings from the International Federation of Robotics (IFR)?

The IFR's World Robotics 2017 report reveals that the global industrial robot market continues to grow at a rapid pace. In 2016, a record number of 248,000 robots were shipped worldwide, a 16% increase over the previous year. The demand for robots is particularly strong in the automotive, electronics, and metalworking industries.

Question: Which countries are leading the adoption of robotics?

China is the world's largest market for industrial robots, accounting for over 36% of global shipments in 2016. Japan, the United States, South Korea, and Germany are also major robotics markets. However, the adoption of robotics is increasing rapidly in other countries as well, including India, Mexico, and Brazil.

Question: What are the main drivers of the growth in robotics?

The main drivers of the growth in robotics are the rising cost of labor, the need for increased productivity, and the shortage of skilled workers. Robots can perform repetitive tasks faster and more accurately than humans, which can help companies to improve their bottom line. Robots can also work in dangerous or hazardous environments, which can help to protect workers from injury.

Question: What are the challenges facing the robotics industry?

The robotics industry faces a number of challenges, including the high cost of robots, the need for skilled workers to operate and maintain them, and the ethical concerns about the potential impact of robots on jobs and society. However, the IFR is

optimistic that the benefits of robotics outweigh the challenges, and that the industry will continue to grow in the years to come.

Question: What is the future of robotics?

The future of robotics is bright. The IFR expects that the global industrial robot market will continue to grow at a strong pace in the coming years. The development of new technologies, such as artificial intelligence and machine learning, will make robots even more capable and versatile. As a result, robots are likely to play an increasingly important role in our lives and in the global economy.
