Question 1: Determine the shear force and bending moment diagrams for a simply supported beam with a uniformly distributed load.

Answer: For a simply supported beam with a uniformly distributed load, the shear force diagram is a triangle with a maximum value of $wl/2$ at the center of the span. The bending moment diagram is a parabola with a maximum value of $wl^2/8$ at the center of the span.

Question 2: Analyze a truss structure using the method of joints.

Answer: The method of joints involves analyzing a truss structure by calculating the forces in the members at each joint in equilibrium. This can be done by applying the equations of equilibrium to each joint, considering the forces acting on it and the internal forces in the members connected to it.

Question 3: Solve for the deflection of a cantilever beam with a concentrated load.

Answer: The deflection of a cantilever beam with a concentrated load can be determined using the formula: $y = -PL^3/(3EI)$, where y is the deflection at the free end of the beam, P is the concentrated load, L is the length of the beam, E is the modulus of elasticity, and I is the moment of inertia of the beam cross-section.

Question 4: Calculate the critical buckling load for a slender column.

Answer: The critical buckling load for a slender column is given by: $P_{cr} = \frac{\pi^2 EI}{L^2}$, where P_{cr} is the critical buckling load, E is the modulus of elasticity, I is the moment of inertia of the column cross-section, and L is the length of the column.

Question 5: Analyze a moment-resisting frame using slope-deflection equations.
