Q: Why use Spring Boot for Microservices? A: Spring Boot is a popular choice for building microservices because it offers autoconfiguration, dependency

management, and a lightweight container. This reduces development time and makes it easier to create and manage independent, modular services.

Q: How to Get Started with Spring Boot? A: To start with Spring Boot, install the Spring Initializr, a web-based tool that helps generate a basic project structure. You can then add dependencies, such as Spring MVC, Spring Data, and others, as needed.

Q: How to Build a Microservice with Spring Boot? A: To create a microservice with Spring Boot, use annotation-based configuration to define the service's functionality. Spring Boot will automatically register components, configure endpoints, and handle dependency injection. You can also integrate with various frameworks, such as REST API frameworks, for handling HTTP requests and responses.

Q: Best Practices for Spring Boot Microservices A: To build robust and scalable microservices, follow best practices such as: using consistent conventions, implementing circuit breakers for resilience, and monitoring microservices for performance and errors. Additionally, consider using frameworks like Eureka or Consul for service discovery and load balancing.
