What is the difference between the Beck Depression Inventory and the HADS? The HADS was designed for non-psychiatric patients to detect depression as a comorbidity. The BAI can be given to the same patient in subsequent sessions to track the progression or improvement of the anxiety.

What are the criticism of BDI? Shortcomings of the BDI are its high item difficulty, lack of representative norms, and thus doubtful objectivity of interpretation, controversial factorial validity, instability of scores over short time intervals (over the course of 1 day), and poor discriminant validity against anxiety.
