**What two components could you use to implement a infrastructure as code deployment Azure?** A: The two components that you could use to implement infrastructure as code deployment are ARM templates and Azure blueprints.

**What can you use in Microsoft Azure to facilitate the deployment or even the management of existing resources?** Azure Resource Manager, or ARM, is a Microsoft Azure service that allows users to deploy, manage, and monitor Azure resources. ARM simplifies the process of creating and organizing Azure resources, including virtual machines, SQL databases, and storage accounts.

**What is infrastructure management in Azure?** Azure Cloud Infrastructure Management seamlessly integrates on-premises and cloud assets, forming an Azure hybrid infrastructure. This method allows businesses to leverage the benefits of both environments, making sure a bendy, scalable, and green solution is tailor-made to their specific hybrid requirements.

**Which Azure resource can be deployed as infrastructure as a service?** An Azure virtual machine is an example of Infrastructure as a Service (IaaS). Azure web app, Azure logic app and Azure SQL database are all examples of Platform as a Service (PaaS).

**Which three tools can you use to implement infrastructure as code?**

**How do you implement infrastructure as code in Azure?**

**What are the 3 deployment modes that can be used for Azure?** There are three different ways to deploy cloud services: on a public cloud, private cloud, or hybrid

cloud.

**What is the difference between Azure ASM and ARM?** As per this and this Azure documents, Azure Service Manager (ASM) is the old control plane of Azure responsible for creating, managing, deleting VMs and performing other control plane operations whereas Azure Resource Manager (ARM) is the latest control plane of Azure responsible for creating, managing, deleting VMs ...

**Which deployment models are not supported in Azure?** Understand support for the models Cloud Services (classic) doesn't support the Resource Manager deployment model. Cloud Services (extended support) supports the Resource Manager deployment model. Virtual machines, storage accounts, and virtual networks support both Resource Manager and classic deployment models.

**How does Microsoft Azure integrate with existing IT infrastructure?** Extend your existing on-premises Active Directory infrastructure to Azure, by deploying a VM in Azure that runs AD DS as a Domain Controller. This architecture is more common when the on-premises network and the Azure virtual network (VNet) are connected by a VPN or ExpressRoute connection.

**How do I monitor Azure infrastructure?** You can connect your existing System Center Operations Manager management group to Azure Monitor to collect data from agents into Azure Monitor Logs. This capability allows you to use log queries and solutions to analyze data collected from agents.

**What infrastructure does Azure use?** IaaS provides all the infrastructure to support web apps, including storage, web and application servers, and networking resources. Your organization can quickly deploy web apps on IaaS and easily scale infrastructure up and down when demand for the apps is unpredictable.

**What are the 4 types of Azure services?**

**How to automate Azure infrastructure?** Azure portal: Upload the ARM template and define any necessary parameters within the portal. Azure CLI: Use the az deployment create command to deploy the template from the command line. Azure DevOps: Integrate ARM template deployments into your CI/CD pipeline for automated infrastructure provisioning.

**What is an example of Infrastructure as a Service?** Some popular examples of IaaS include Amazon Web Services (AWS), Microsoft Azure, Google Cloud, DigitalOcean, and Linode.

**What are the two ways to approach infrastructure as code?** A declarative approach also keeps a list of the current state of your system objects, which makes taking down the infrastructure simpler to manage. An imperative approach instead defines the specific commands needed to achieve the desired configuration, and those commands then need to be executed in the correct order.

**What components are required to build cloud infrastructure?** There are four core components of cloud infrastructure: hardware, virtualization, storage, and network. Hardware includes physical devices; such as backups, firewalls, load balancers, networking equipment, routers, servers, and storage arrays. Virtualization is used to abstract resources from these hardware devices.

**What are the 3 deployment modes that can be used for Azure?** There are three different ways to deploy cloud services: on a public cloud, private cloud, or hybrid cloud.

**Which Azure service would allow them to implement their cloud resources using infrastructure as code?** Which Azure service would allow them to implement their cloud resources using infrastructure-as-code? Azure Resource Manager Templates. To implement infrastructure as code for your Azure solutions, use Azure Resource Manager (ARM) templates.
