Semiconductor Physics and Devices (3rd Edition) - Q&A

Q1. What is the basic structure of a semiconductor? A1. A semiconductor is a material with an electrical conductivity between that of a conductor and an insulator. It typically consists of a crystalline lattice with covalent bonds between atoms.

Q2. Explain the concept of a p-n junction. A2. A p-n junction is formed when a semiconductor with p-type doping (electron deficiency) is joined to a semiconductor with n-type doping (electron excess). At the junction, a depletion region is created where the majority carriers from both sides recombine, leaving only minority carriers.

Q3. How does a transistor work? A3. A transistor is a three-terminal semiconductor device that acts as an amplifier or switch. It consists of a base, emitter, and collector regions. When a small current is applied to the base, it controls the flow of current between the emitter and collector.

Q4. What is the difference between a bipolar junction transistor (BJT) and a field-effect transistor (FET)? A4. BJTs are controlled by minority carriers, while FETs are controlled by majority carriers. BJTs have three terminals (emitter, base, collector), while FETs typically have four terminals (source, drain, gate, body).

Q5. Describe the role of semiconductor physics in modern electronics. A5. Semiconductor physics is the foundation of almost all modern electronic devices.
