**What is the study of endocrinology?** Endocrinology is the study of hormones and endocrine glands and organs. Hormone-secreting glands and certain organs in your body make up your endocrine system.

**What is the best definition of endocrinology?** Listen to pronunciation. (EN-doh-krih-NAH-loh-jee) A branch of medicine that specializes in diagnosing and treating disorders of the endocrine system, which includes the glands and organs that make hormones. These disorders include diabetes, infertility, and thyroid, adrenal, and pituitary gland problems.

**What is the subject of endocrinology?** The branch of science dealing with hormones is called endocrinology, which concerns the normal biology and diseases of hormone production and action. It can also be defined as the study of the anatomy, physiology, and pathologic functions of the endocrine organs and of the diagnosis and treatment of endocrine problems.

**What is the introduction of endocrinology?** Classically, endocrinology has been defined as “The study of the system of glands and tissues that produce and secrete hormones”—the latter being active regulatory substances formed in one part of the body and carried by the blood to another, where they signal the coordination of cellular functions.

**What is the most common disease treated by an endocrinologist?** Who is an endocrinologist? The most common diseases treated by an endocrinologist include diabetes mellitus type 1 and type 2, Thyroid disorders, hypothyroidism, hyperthyroidism, and goiter. An endocrinologist is a specialist doctor who treats

imbalances of hormones or the endocrine system of the body.

**Why is it so hard to see an endocrinologist?** The reasons for this national shortage of diabetes specialists are manifold: Endocrinologists receive the lowest compensation of all internal medicine (IM) specialties — lower even than practicing general internists — and 76–89% of medical students graduate with astronomical debt.

**Why would a patient be referred to an endocrinologist?** If a person sees a physician about symptoms of a health problem, the physician may refer them to an endocrinologist. They will do this if they believe the underlying cause may be hormone related. Endocrinologists are doctors trained to diagnose and manage diseases that affect the glands and hormones.

**What does an endocrinologist treat you for?** “An endocrinologist is responsible for evaluating diabetes, bone loss, and a range of hormonal issues, including hormones from the pituitary, adrenal, and thyroid glands as well as reproductive organs,” Dr. Smooke Praw explains. Patients come to endocrinologists knowing something is going on in their bodies.

**Why might someone see an endocrinologist?** Endocrinologists are qualified to diagnose and treat conditions like diabetes, thyroid diseases, infertility, growth issues, metabolic disorders, osteoporosis, some cancers, and disorders in the hormone-producing adrenal glands and pituitary glands.

**How does an endocrinologist examine you?** They will examine your skin, hair, mouth, and teeth as hormone-related disorders can affect these areas. Additionally, they may order blood work or urinalysis, order a biopsy, or order imaging tests such as computed tomography or magnetic resonance imaging.

**What organs does endocrinology cover?** The endocrine system includes the hypothalamus, pineal gland, pituitary gland, thyroid gland, parathyroid glands, thymus, adrenal glands, and pancreas.

**What falls under endocrinology?** Endocrinologists diagnose and treat a wide range of conditions affecting the endocrine system, including diabetes mellitus, thyroid disorders, osteoporosis, growth hormone deficiency, infertility, cholesterol

problems, hypertension (high blood pressure), obesity and more.

**Why does an endocrinologist look at your hands?** "It used to be common for doctors to look at the hands for important clues to overall health," says endocrinologist Kenneth Blanchard. "Hands can tell you a great deal about circulation, hormones, and thyroid function."

**What is special about endocrinology?** Endocrinology is the study of hormones. Hormones are essential for our every-day survival. They control our temperature, sleep, mood, stress, growth and more. An endocrinologist is a doctor that treats diseases related to problems with hormones.

**What are the four major endocrine conditions?** Adrenal insufficiency. Hyperthyroidism and Hypothyroidism. Cushing's disease. Gigantism (acromegaly) and other growth hormone problems.
