Solved Question Papers of RDBMS 2

Q1. Explain the concept of primary key and foreign key. **A1.** A primary key uniquely identifies each row in a table, ensuring no duplicate records. A foreign key references a primary key in another table, establishing a relationship between the two tables.

Q2. What is the difference between a trigger and a stored procedure? **A2.** Triggers are event-driven actions that execute automatically when specific events occur in a database, such as inserting, updating, or deleting data. Stored procedures are user-defined functions that can be executed manually or called from within other programs.

Q3. Describe the benefits of using normalization in database design. **A3.** Normalization reduces data redundancy and inconsistencies by splitting tables into smaller, more specific ones. It improves performance, reduces storage requirements, and ensures data integrity.

Q4. Explain the role of transaction management in RDBMS. **A4.** Transaction management ensures the atomicity, consistency, isolation, and durability (ACID) properties of database transactions. It ensures that changes made within a transaction are either all committed or rolled back, maintaining data integrity.

Q5. Discuss the advantages and disadvantages of using a NoSQL database over a relational database. A5.

NoSQL databases offer flexibility, scalability, and performance for large volumes of unstructured data. However, they lack the structured data handling and query capabilities of relational databases, which are more suitable for traditional data processing applications.
