Thermodynamics Problems and Solutions: A Comprehensive Guide

Thermodynamics, a branch of physics dealing with heat and its relation to other forms of energy, plays a crucial role in various fields of science and engineering. To enhance understanding and develop problem-solving skills in thermodynamics, it is essential to practice with a variety of problems.

Question 1: A system undergoes a reversible isothermal process from state A to state B. Calculate the change in entropy.

Answer: In an isothermal process, temperature remains constant. Therefore, the change in entropy is given by $\Delta S = Q/T$, where Q is the heat transferred into the system and T is the absolute temperature. Since the process is reversible, $Q = 0$, resulting in $\Delta S = 0$.

Question 2: A gas expands adiabatically from a volume of 2 m^3 to a volume of 8 m^3 , with an initial pressure of 100 kPa . Determine the final pressure.

Answer: In an adiabatic process, no heat is transferred into or out of the system. The process is assumed to be isentropic ($\Delta S = 0$), and the ideal gas law ($PV = nRT$) can be used to solve for the final pressure.

Question 3: A Carnot cycle operates between temperatures $T_1 = 500 \text{ K}$ and $T_2 = 300 \text{ K}$. The amount of heat transferred to the engine during the isothermal expansion is 1000 kJ . Calculate the efficiency of the cycle.

Answer: The efficiency of a Carnot cycle is given by $(T_1 - T_2)/T_1$. Substituting the given values, we get an efficiency of 0.4.

Question 4: A system undergoes a constant-pressure process from state A ($P = 100$ kPa, $V = 1$ m³, $T = 300$ K) to state B ($P = 100$ kPa, $V = 2$ m³, $T = 500$ K). Calculate the heat transferred into the system.

Answer: For a constant-pressure process, the heat transferred into the system is given by $Q = P(V_2 - V_1)$. Substituting the given values, we get $Q = 100$ kPa * $(2$ m³ - 1 m³) = 100 kJ.

Question 5: A closed system of 1 kg of water undergoes a reversible isobaric process from a temperature of 20°C to 50°C. Determine the work done by the system.

Answer: In an isobaric process, pressure remains constant. The work done by the system is given by $W = P(V_2 - V_1)$. Since the specific volume of water at the given temperatures is almost constant, the work done is negligible.
