Solution of Computer Organization and Architecture by William Stallings, 7th Edition

Q1: Define computer architecture and organization.

A1: Computer architecture refers to the logical structure, instruction set, and function of a computer system. It defines the interface between the software and hardware components. Computer organization, on the other hand, focuses on the physical design, implementation, and interconnection of hardware components to meet the architectural requirements.

Q2: Explain the role of the control unit in a computer system.

A2: The control unit is the central nervous system of a computer. It fetches instructions from memory, decodes them, and generates control signals to orchestrate the execution of those instructions. It manages the flow of data and instructions throughout the system, ensuring that all components work in sync.

Q3: Describe the different types of computer buses.

A3: Computer buses are communication channels that connect various components within the system. There are several types of buses, including the system bus,

expansion bus, and I/O bus. Each bus has specific functions and speed requirements, such as connecting the CPU to memory or allowing external devices to interface with the system.

Q4: Explain the concept of virtual memory.

A4: Virtual memory is a technique used to overcome the limitations of physical memory by creating a virtual address space that is larger than physical memory. It allows multiple processes to share memory space and provides the illusion of having a larger amount of memory than physically available.

Q5: Discuss the different levels of the memory hierarchy.

A5: The memory hierarchy is structured based on speed, capacity, and cost. It consists of various levels, including registers, cache memory, main memory, secondary memory, and tertiary memory. Registers are the fastest but smallest, followed by cache, main memory, secondary memory, and tertiary memory. Each level is slower and larger than the previous one.
