What is prehistoric life? What is meant by “Prehistoric Life?” Prehistoric life refers to all things that lived on Earth between the origin of life 3.5 billion years ago and 3500 B.C. when humans began to keep written records. In this guide, we focus on prehistoric animals that lived between 200 million and 10,000 years ago.

Would a human survive prehistoric times? If we used a time machine to travel back to a prehistoric period, the earliest we could survive would be the Cambrian (around 541 million years ago). Any earlier than that and there wouldn't have been enough oxygen in the air to breathe.

How did humans live in prehistory? In the Paleolithic period (roughly 2.5 million years ago to 10,000 B.C.), early humans lived in caves or simple huts or tepees and were hunters and gatherers. They used basic stone and bone tools, as well as crude stone axes, for hunting birds and wild animals.

Skeletal Muscle Physiology Lab Answers: URSTAR

1. Identify the different types of skeletal muscle fibers and their functions.

- **Type I (slow twitch):** Endurance fibers that contract slowly and fatigue-resistant.
- **Type IIA (fast twitch oxidative-glycolytic):** Intermediate fibers that have both endurance and power characteristics.
- **Type IIB (fast twitch glycolytic):** Power fibers that contract quickly and fatigue easily.

2. Describe the action potential waveform and explain how it triggers muscle contraction.

- The action potential waveform consists of a rapid depolarization phase, a more prolonged repolarization phase, and an afterhyperpolarization phase.
- When an action potential reaches the neuromuscular junction, it releases acetylcholine, which binds to receptors on the muscle fiber and causes depolarization of the muscle membrane, initiating muscle contraction.

3. Explain the role of calcium ions in muscle contraction.

- Calcium ions are released from the sarcoplasmic reticulum in response to an action potential and bind to troponin, which triggers a conformational change that allows myosin to interact with actin, initiating muscle contraction.

4. What is the relationship between muscle length and tension?

- The relationship between muscle length and tension is described by the length-tension curve, which shows that active tension increases with muscle length up to an optimal point, after which it decreases.

5. How does load affect muscle contraction?

- Load refers to the resistance against which a muscle contracts. Increasing load increases the force output of the muscle up to a maximum, beyond which the muscle cannot contract effectively.
