

Anatomy of the knee in pictures

[Download Complete File](#)

What are the three most commonly injured knee structures? The most common knee injuries include tears of soft tissues (e.g., ligaments, meniscus), fractures, and dislocation.

What are the common locations of knee pain? The location of knee pain can help identify the problem. Pain on the front of the knee can be due to bursitis, arthritis, or softening of the patella cartilage as in chondromalacia patella. Pain on the sides of the knee is commonly related to injuries to the collateral ligaments, arthritis, or tears to the menisci.

What are the parts of the knee? What are the parts of the knee? Your knee is made up of four main things: bones, cartilage, ligaments, and tendons. (femur), shinbone (tibia), and kneecap (patella). Your patella sits in front of the joint and provides some protection.

What are the 11 ligaments of the knee joint?

What are three signs of a meniscus tear in the knee?

What is the hardest knee injury to recover from? A torn anterior cruciate ligament (ACL) is the hardest sports injury that takes more recovery time. It is usually 12 months.

How do I know if knee pain is joint or muscle? Joint pain usually takes longer to heal than muscle pain and may come with swelling of the affected joint. Since joint pain goes deeper than a muscle injury, it will likely continue to hurt even when you're resting.

What kind of knee pain should I worry about? Contact your provider if: You cannot bear weight on your knee. You have severe pain, even when not bearing weight. Your knee buckles, clicks, or locks.

What is the number 1 cause of knee pain? The most common causes of knee pain are related to aging, injury or repeated stress on the knee. Common knee problems include sprained or strained ligaments, cartilage tears, tendonitis and arthritis.

What is the best painkiller for knee pain? Over-the-counter medications — such as ibuprofen (Advil, Motrin IB, others) and naproxen sodium (Aleve) — may help ease knee pain. Some people find relief by rubbing the affected knee with creams containing a numbing agent, such as lidocaine, or capsaicin, the substance that makes chili peppers hot.

How do I know if my knee needs surgery? Constant pain One of the main signs a knee replacement is needed is severe and prolonged pain in the knee and the surrounding area.

What are the symptoms of a torn tendon in the knee?

Is it better to rest or walk with knee pain? Treating the pain when it happens can help manage it. Follow the “RICE” procedure — rest, ice, compression, elevation — to calm your knee pain. If your knee hurts, stop what you're doing and rest. Apply ice to reduce inflammation, consider wearing a compression bandage, and elevate your knee when resting.

Can you still walk with a torn ligament in your knee? The short answer is yes. After the pain and swelling subsides and if there is no other injury to your knee, you may be able to walk in straight lines, go up and down stairs and even potentially jog in a straight line. The ACL (anterior cruciate ligament) is an important ligament that provides stability to the knee.

What are the symptoms of a torn ligament in your knee?

Is walking good for a torn meniscus? Will Walking on a Torn Meniscus Make It Worse? In cases with acute tears, you may be able to walk around with only slight

discomfort or minimal pain. However, if you're noticing increased pain or have a severe tear, you should avoid walking on it until some pain starts to dissipate.

Will a knee brace help a torn meniscus? In addition to physical therapy, bracing is another conservative option sometimes tried after a meniscus tear. The goal of a knee brace is to protect it from further injury by providing stability and preventing you from overextending it beyond regular range of motion, and reducing the load on the meniscus.

What part of the knee hurts with a torn meniscus? Symptoms of a meniscus tear may be different for each person, but some of the most common symptoms are: Pain in the knee joint: usually on the inside (medial), outside (lateral) or back of the knee. Swelling. Catching or locking of the knee joint.

How do I tell if I tore something in my knee?

Is it worse to tear an ACL or meniscus? Both a torn meniscus and ACL are painful in their own regard. Although when it comes to recovery, it takes an ACL tear longer to heal. On the other hand, a meniscus tear can return to its original shape in three months without surgery.

How do I know if I've permanently damaged my knee? Signs of a more serious injury, that require specialist intervention, include being unable to bend, move or straighten your knee, or your knee locks, painfully clicks or buckles when you put weight on it.

What is the #1 mistake that makes bad knees worse? 1. You aren't moving enough. One of the biggest mistakes we see patients with knee pain make is to begin using their knees less. For example, if you have osteoarthritis and moving your knee hurts, you may think the best approach is to rest your joint and let it heal.

What should you not do if your knee hurts?

What is the best exercise for knee pain?

What is the most commonly damaged structure of the knee? The ACL and MCL are the ligaments most often injured. These injuries usually happen in sports such as soccer, football, and basketball where the knee might experience a sudden twisting

motion, a rapid change in direction, or an incorrect landing from a jump.

Which structures of the knee are most commonly prone to injury? The most commonly injured ligaments include the cruciate ligaments which make up the X - the anterior cruciate ligament (ACL) and the posterior cruciate ligament (PCL). The collateral ligaments - the medial collateral ligament (MCL) and the lateral collateral ligament (LCL) - are also commonly injured.

What 3 structures are torn in a knee dislocation? Commonly, a knee dislocation involves injury to the ACL, PCL, and either the medial collateral ligament (MCL) or the lateral-side structures of the knee.

What are the 3 important structural features of the knee? The three parts (compartments) of the knee joint are found where the joint surfaces of the femur, tibia, and the back of the kneecap meet: The joint between the femur and tibia on the inner side of the knee (medial compartment) The joint between the femur and tibia on the outer side of the knee (lateral compartment)

Is it better to rest or walk with knee pain? Treating the pain when it happens can help manage it. Follow the “RICE” procedure — rest, ice, compression, elevation — to calm your knee pain. If your knee hurts, stop what you're doing and rest. Apply ice to reduce inflammation, consider wearing a compression bandage, and elevate your knee when resting.

What is the most painful thing to tear in your knee? Ligament injuries in the knee -- such as an anterior cruciate ligament (ACL) -- can put you on the sidelines -- fast. They hurt a lot and may limit what you can do. But more often than not, a comeback may still be possible.

What are the symptoms of a torn tendon in the knee?

What is the best painkiller for knee pain? Over-the-counter medications — such as ibuprofen (Advil, Motrin IB, others) and naproxen sodium (Aleve) — may help ease knee pain. Some people find relief by rubbing the affected knee with creams containing a numbing agent, such as lidocaine, or capsaicin, the substance that makes chili peppers hot.

What are the symptoms of a torn ligament in your knee?

What is the figure 4 test for knee pain? The way that this test works is that the popliteus tendon normally pulls the meniscus out of the joint when the knee is brought into a figure-of-4 position. However, when the popliteomeniscal fascicles are torn, the meniscus will sublux back into the joint and becomes pinched.

What happens when your knee pops out and back in? Definition: The patella (knee cap) slides in and out of a groove in the femur (thigh bone) as the knee bends and straightens. If the patella pops out of the groove this is called a dislocated patella. If the patella pops out and then immediately gets back into the groove then it is called a subluxated patella.

How to treat a knee that pops out of place? A person with a dislocated kneecap needs care at the hospital right away. After giving pain medicine, the doctor or another health care provider will gently slide the kneecap back into place while straightening the leg. This quick maneuver is called a reduction. Then, they'll order an X-ray to check for fractures.

What does knee subluxation feel like? Most patients experience a sensation that the kneecap has shifted or moved out of place. Usually, the kneecap will move back in on its own but sometimes it will need to be put back in place in the Emergency Room. With chronic patellar subluxations, the pain may be less severe than in a traumatic injury.

How to test for knee ligament injury at home? Try gently bending and straightening your knee. Notice if you encounter any resistance, discomfort, or pain. If you find those movements challenging, this could indicate a potential ligament injury. If you cannot move your leg in any direction, contact your doctor as soon as possible.

What does it mean when the back of your leg hurts behind the knee? There are many different causes of posterior knee pain, including injury, inflammation or infection of the knee joint, overuse, wear and tear with age, osteoarthritis, rheumatoid arthritis, cysts or in very rare cases, cancer. Leg cramps occur when your leg muscles tighten up.

Why does the side of my knee hurt? Side knee pain is commonly caused by osteoarthritis ("wear-and-tear arthritis"), injuries to the collateral ligaments, tears to the meniscus, or sprains. If the cartilage in your knee is injured you won't have cartilage pain because cartilage doesn't contain nerves.
