Unlocking Statistical Mastery with "The Practice of Statistics 3rd Edition" Answer Key

"The Practice of Statistics 3rd Edition" by Daniel S. Yates, Daren S. Starnes, and David S. Moore is an esteemed textbook widely used in introductory statistics courses. To facilitate a deeper understanding of statistical concepts, an answer key plays a pivotal role. Here's a glimpse into some key questions and their corresponding answers from the textbook:

1. Question: A random sample of 50 individuals yields a sample mean of 10. If the standard deviation is known to be 5, calculate the 95% confidence interval for the population mean.

Answer: Using the formula for a confidence interval, we have: $CI = \bar{x} \pm z^* (\frac{s}{\sqrt{n}}) = 10 \pm 1.96 (5/\sqrt{50}) = 10 \pm 2.94$ Therefore, the 95% confidence interval is (7.06, 12.94).

2. Question: A survey reports that 30% of adults support a particular policy. If a random sample of 200 adults is selected, what is the probability that the sample proportion will be within 0.05 of the true population proportion?

Answer: Using the Central Limit Theorem and the normal distribution, we can calculate the standard error of the proportion as: $SE = \sqrt{(p(1-p)) / n} = \sqrt{(0.3 \cdot 0.7) / 200} = 0.035$ Then, we can use the z-score formula to find the probability: $P(-0.05/0.035 < Z < 0.05/0.035) = P(-1.43 < Z < 1.43) = 0.8508$ (using a standard normal table or calculator)

3. Question: A researcher wants to test the hypothesis that the mean of a normally distributed population is equal to 100. A sample of 100 observations yields a sample mean of 102 with a standard deviation of 15. Using a significance level of 0.05, conduct a hypothesis test.

Answer: The null hypothesis is $H_0: \mu = 100$, and the alternative hypothesis is $H_a: \mu \neq 100$. The test statistic is: $t = (\bar{x} - \mu) / (\sigma / \sqrt{n}) = (102 - 100) / (15 / \sqrt{100}) = 1.333$ Using a t-distribution table with 99 degrees of freedom ($df = n-1$), the p-value is 0.1867. Since the p-value is greater than 0.05, we fail to reject the null hypothesis and conclude that there is not enough evidence to suggest that the population mean is different from 100.

4. Question: A regression analysis is conducted to examine the relationship between advertising expenditure and sales. The estimated regression equation is: $Sales = 100 + 0.5 * Advertising$ If advertising expenditure increases by 20 units, what is the predicted increase in sales?

Answer: The change in sales can be calculated as: $\Delta Sales = 0.5 * \Delta Advertising = 0.5 * 20 = 10$ Therefore, the predicted increase in sales is 10 units.

5. Question: A contingency table summarizes the cross-classification of two categorical variables:

	Support	Oppose	Total
Male	100	50	150
Female	50	100	150
Total	150	150	300

Conduct a chi-square test to determine if there is an association between gender and support for a policy.

Answer: The chi-square statistic is calculated as: $\chi^2 = \sum [(O - E)^2 / E] = 10.0$ Using a chi-square distribution table with 1 degree of freedom ($df = (r-1) * (c-1)$), the p-value is 0.0016. Since the p-value is less than 0.05, we reject the null hypothesis and conclude that there is a significant association between gender and support for the policy.
