Q&A on Transport Phenomena by Bird, 2nd Edition

1. Question: Derive the differential equation for convection-diffusion in one dimension.

Answer: The differential equation for convection-diffusion in one dimension is:

$$\frac{\partial c}{\partial t} + u \frac{\partial c}{\partial x} = D \frac{\partial^2 c}{\partial x^2}$$

where c is the concentration, u is the velocity, t is time, x is the distance, and D is the diffusion coefficient.

2. Question: Explain the physical significance of the Péclet number.

Answer: The Péclet number (Pe) is a dimensionless number that represents the ratio of convective to diffusive transport. A high Pe number indicates that convection is dominant, while a low Pe number indicates that diffusion is dominant.

3. Question: Describe the boundary layer concept in fluid mechanics.

Answer: The boundary layer is a thin layer of fluid near a surface where the velocity gradient is significant. The boundary layer is formed due to the no-slip condition at the surface, which requires the fluid velocity to be zero at the surface.

4. Question: Explain the difference between laminar and turbulent flow.

Answer: Laminar flow is characterized by smooth, orderly fluid motion, while turbulent flow is characterized by chaotic, irregular fluid motion. The transition from laminar to turbulent flow occurs when the Reynolds number exceeds a critical value.

5. Question: Discuss the heat transfer mechanisms in a solid.

Answer: Heat transfer in a solid occurs through conduction, which is the transfer of energy through molecular collisions. The rate of heat transfer by conduction is proportional to the temperature gradient and the thermal conductivity of the solid.
