Section 11.4 Meiosis Worksheet Answers

Question 1: What is the purpose of meiosis? Answer: The purpose of meiosis is to produce gametes (eggs and sperm) with half the number of chromosomes as the parent cell.

Question 2: Describe the four stages of meiosis. Answer: The four stages of meiosis are:

- Prophase I: The chromosomes condense and the homologous chromosomes pair up.

- Metaphase I: The homologous chromosomes line up in the middle of the cell.
- Anaphase I: The homologous chromosomes separate and move to opposite ends of the cell.
- Telophase I and Cytokinesis: The chromosomes reach the poles of the cell and two daughter cells are formed.

Question 3: How many chromosomes are in a typical human gamete? Answer:

A typical human gamete has 23 chromosomes, half the number of chromosomes as a typical human somatic cell.

Question 4: What is the difference between mitosis and meiosis? Answer:

Mitosis is the process of cell division that produces two daughter cells that are genetically identical to the parent cell. Meiosis is the process of cell division that produces four daughter cells that are genetically different from the parent cell.

Question 5: Explain the significance of genetic recombination in meiosis.

Answer: Genetic recombination is the process of exchanging genetic material between homologous chromosomes during meiosis. This process shuffles the genes and creates new combinations of alleles. Genetic recombination contributes to genetic diversity and ensures that offspring are genetically different from their parents.
