Solution Physical Chemistry Atkins 9th Ed: Practice Questions and Answers

1. Describe the concept of colligative properties.

Colligative properties are properties of solutions that depend only on the number of solute particles present, not on their identity. These properties include vapor pressure lowering, boiling point elevation, freezing point depression, and osmotic pressure.

2. Explain the concept of intermolecular forces.

Intermolecular forces are the weak forces that act between molecules. These forces determine the physical properties of substances, such as their melting point, boiling point, and viscosity. There are three main types of intermolecular forces: van der Waals forces, dipole-dipole forces, and hydrogen bonding.

3. Describe the process of osmosis.

Osmosis is the movement of water across a semipermeable membrane from an area of low solute concentration to an area of high solute concentration. The direction of osmosis is determined by the difference in water potential between the two areas.

4. Explain the effect of temperature on colligative properties.

The colligative properties of solutions increase with increasing temperature. This is because the higher the temperature, the more kinetic energy the molecules have, and the more likely they are to overcome intermolecular forces and move away from each other.

5. Describe the concept of Raoult's law.

Raoult's law states that the partial pressure of a solvent above a solution is equal to the product of its mole fraction and the vapor pressure of the pure solvent. This law can be used to determine the vapor pressure of a solution and the composition of a liquid-vapor equilibrium.

System Analysis of a Hotel Reservation System
