**What is passivity based control?** Passivity based control is a methodology which consists in controlling a system with the aim at making the closed loop system, passive. The field constitutes an active research direction and therefore in this chapter we give only a basic overlook of the most important concepts involved.

**What is passive assistance in robotics?** ? Passive Training —robots provide assistance to move, and patients' active efforts are not considered explicitly in movement control. ? Active Training —robots provide limited assistance or add resistance according to the participant's motion intention.

**What are passive control techniques?** Passive control systems use simple, low cost devices that reduce the vibration of structures by absorbing and dissipating energy. The controller starts to operate and produce control forces with the motion of the structure.

**What is an example of passivity?** Passivity is allowing others to do things to you without complaining or pushing back. The baby-sitter's passivity led her charges to walk all over her. They stayed up all night and tied her to the chair, and all she said was, "Please stop misbehaving."

**What is passive compliance in robotics?** Passive compliance is applied during the setup of the robotic cell and will always stay active in the background to fulfill its safety role. It may be inherent to the structure of the robot, like a torque limitation device on the end effector or a torque limitation on the joints.

**What is a passive manipulator in robotics?** Passive manipulators have no actuators, or in other words, there is no motor or pneumatic cylinder which is directly attached to the manipulator. The rules of many robotics games include limitations on the number of motors and/or the amount of pneumatic air storage a robot can possess.

**What is the difference between active assistance and passive assistance?** When passive range of motion is applied, the joint of an individual receiving exercise is completely relaxed while the outside force moves the body part, such as a leg or arm, throughout the available range. Active Assisted Range of Motion (AAROM): Joint receives partial assistance from an outside force.

**What are passive controls?** Passive control is a term applied to survey marks that are “permanently” monumented and infrequently surveyed, whereas the term active control was developed for Continuously Operating Reference Stations (CORS), as well as other geodetic techniques that are constantly collecting data.

**What is passive control theory?** Passive control is often part of the safety requirements in applications such as process control, tele-operation, human-machine interfaces, and system networks. A system is passive if it cannot produce energy on its own, and can only dissipate the energy that is stored in it initially.

**What is passivity of control schizophrenia?** Passivity experiences are hallmark symptoms of schizophrenia. They are characterized by the belief that one's thoughts or actions are influenced or controlled by an external agent, for example when a psychotic patient is experiencing the movement of his own limbs like a passive observer (Frith, 2005).

**What is an example of a passivity phenomenon?** Specific passivity phenomena include: (a) 'made thoughts', whereby patients experience their thoughts as influenced or replaced by an external entity; (b) 'thought broadcast/withdrawal',

whereby patients believe their thoughts can be 'heard' or removed by an external entity; (c) 'made emotions', whereby patients ...
