A Glow-worm boiler not firing up with no fault code might be attributed to several factors: Blocked Plate Heat Exchanger: The transfer of heat could be hindered, preventing operation. Stuck or Damaged Diverter Valve: Essential for directing hot water, if stuck, the boiler may cease to function.

Why is the water not hot in my Glow-worm boiler? If water pressure gets too low, or too high, the system will automatically switch off, resulting in no hot water in your home. Optimum boiler pressure should sit between 1 and 2 bars. A boiler error associated with a water pressure issue will result in your Glow-worm boiler screening the F7 fault code.

Why does my Glow-worm boiler keep firing up? This is simply the boiler making sure there's some hot water ready to be sent to the taps when you need it, and it's nothing to be concerned about. However, if the boiler keeps repeatedly firing up and then quickly turning off again, this could be a sign that it's short cycling.
