Theory of Computation Questions with Answers

The Theory of Computation is a branch of computer science that focuses on understanding the computational capabilities and limitations of computers. Here are some key questions and answers related to this field:

1. What is a Turing machine? An abstract computational model introduced by Alan Turing that can perform any computation that a computer can. It consists of a tape divided into cells, a head that reads and writes symbols on the tape, and a finite set of states.

2. What is the Church-Turing thesis? It states that any computation that can be done by any other computational model can also be done by a Turing machine. In essence, it claims that the Turing machine is the most powerful abstract model of computation.

3. What is the halting problem? A famous problem in computer science that asks whether there exists an algorithm that can determine whether any given Turing machine will halt or continue running indefinitely. Alan Turing proved that no such algorithm exists.

4. What are NP-complete problems? A class of problems that can be solved by a non-deterministic Turing machine in polynomial time. Many practical problems, such as the traveling salesman problem and the knapsack problem, are NP-complete.

5. What is the complexity class P? The class of problems that can be solved by a deterministic Turing machine in polynomial time. Many common computational tasks, such as sorting a list or finding the minimum value in an array, belong to class P.
