## **Stationary and Related Stochastic Processes: Sample Function Properties and Applications**

**By M. Ross Leadbetter**

### **What are stationary and related stochastic processes?**

Stochastic processes model systems that evolve over time or space. A stochastic process is **stationary** if its statistical properties (e.g., mean, variance) remain constant over time. Related processes include **ergodic processes**, whose sample averages converge to population averages, and **mixing processes**, which exhibit increasing independence over time.

### **What are some sample function properties of stationary and related processes?**

Stationary processes have **constant mean and variance**, and their **autocorrelation function** (ACF) depends only on the lag between time points. Ergodic processes have **sample averages that converge** to population averages, and their ACF vanishes over time. Mixing processes have **increasing independence** over time, as reflected by their rapidly decreasing ACF.

### **How are these properties used in applications?**

Stationary processes are used in **time series analysis**, where their constant properties allow for modeling and forecasting. Ergodic processes are useful in **estimating population parameters** from sample data, as their sample averages provide reliable estimates. Mixing processes are applied in **random number generation**, where their increasing independence ensures randomness.

### **Can you provide an example of a stationary process?**

**White noise** is a stationary process with a constant mean of 0 and an ACF that is 0 for all lags except 0. It is often used as a noise model in signal processing and communication systems.

### **Can you provide an example of an ergodic process?**

**Independent and identically distributed (i.i.d.) processes** are ergodic, as the sample average of an i.i.d. sample converges to the population mean. They are used in statistics and probability to represent random samples from a fixed distribution.\_\_\_\_\_
