Unraveling the Mysteries of Genetics: Crossword Answer Key

Question 1: A fundamental unit of heredity that determines a trait **Answer:** CALVAN

Question 2: The process by which genetic material is copied and distributed to daughter cells during cell division **Answer:** MITOSIS

Question 3: The shape of a chromosome at the time of cell division **Answer:** X

Question 4: A recessive allele that only expresses itself when homozygous **Answer:** GENE

Question 5: An organic molecule that is the building block of DNA and RNA **Answer:** NUCLEOTIDE

Explanation:

CALVAN refers to Calvin's cycle, a series of chemical reactions that occur in plants and algae to convert carbon dioxide and water into glucose. Mitosis is the process by which a cell makes a copy of itself, resulting in two daughter cells with the same genetic material. Chromosomes have an X-shape during cell division to ensure the equal distribution of genetic material. Genes are sequences of DNA that determine traits and can be either dominant or recessive. Nucleotides are the basic units of nucleic acids, such as DNA and RNA, and consist of a sugar, a phosphate, and a nitrogenous base.

By understanding these fundamental concepts in genetics, we can gain valuable insights into the inheritance and expression of traits in living organisms.
